Given an integer array `arr` of **distinct** integers and an integer `k`.

A game will be played between the first two elements of the array (i.e. `arr[0]` and `arr[1]`). In each round of the game, we compare `arr[0]` with `arr[1]`, the larger integer wins and remains at position 0, and the smaller integer moves to the end of the array. The game ends when an integer wins `k` consecutive rounds.

Return the integer which will win the game.

It is **guaranteed** that there will be a winner of the game.

Example :-

`arr = { 8, 1, 3, 5, 4, 6, 7 }, K = 2`

Output = 5

`arr = { 1, 25, 68, 35, 42, 70 }, K = 3`

Output = 68
